Title: **Meet Minutes – AI-Powered Meeting Minutes and Task Management System**

Tech Stack: React JS, Java, Spring boot, Postgres SQL, Gemini API.

Meet Minutes is a web-based application designed to automate the process of documenting meetings, extracting important information, and managing follow-up tasks. In conventional meetings, important discussions, decisions, responsibilities, and deadlines are often recorded manually, which can be time-consuming and may result in missing or inaccurate information. This project addresses these challenges by using Artificial Intelligence to automatically convert meeting conversations or transcripts into structured and actionable meeting minutes.

The system allows users to create and manage meetings, add participants, record or provide meeting transcripts, and generate organized meeting minutes. The AI component analyses the meeting content and identifies key information such as the meeting summary, important discussion points, decisions made, action items, assigned participants, and deadlines. The extracted action items can then be converted into tasks and tracked through different stages such as pending, in progress, and completed.

The application follows a client-server architecture. The frontend is developed using **React.js with Vite and Tailwind CSS**, while the backend is implemented using **Java and Spring Boot** to provide secure REST APIs and business logic. **PostgreSQL** is used for persistent data storage, with **Spring Data JPA and Hibernate** for database interaction. **Spring Security and JWT-based authentication** are used to secure user accounts and application resources. An AI service such as the **Gemini API** is integrated to perform meeting summarization and structured information extraction.

KEYWORDS: Artificial Intelligence, Meeting Summarization, Task Management, Action Item Extraction, Natural Language Processing, Spring Boot, React JS, PostgreSQL
